(54) METHOD, DEVICE, AND SYSTEM FOR SHAPING WAVEFORM OF SIGNAL LIGHT

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a new waveform shaping technology which does not rely upon the bit rate or pulse shape of signal light with respect to a method, device, and system for shaping the waveform of a signal light.

SOLUTION: A device for shaping waveform of signal light is provided with a distributed feedback(DFB) laser 2 having a blocking band that is defined as the range of wavelengths which can be oscillated from the laser 2, and a driving circuit 4 which supplies a driving current to the laser 2 so that the laser 2 may oscillate at a first wavelength contained in the blocking band. Signal light having a second wavelength which is not contained in the blocking band is inputted to the laser 2. When the signal light is provided with an optical pulse having a high level and a low level, the amplitude fluctuation of the signal light at the high level can be suppressed effectively by appropriately setting the power of the signal light.

LEGAL STATUS

- [Date of request for examination] 12.07.2001
- [Date of sending the examiner's decision of rejection]
- [Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
- [Date of final disposal for application]
- [Patent number]
- [Date of registration]
- [Number of appeal against examiner's decision of rejection]
- [Date of requesting appeal against examiner's decision of rejection]
